

N11

This astronomical image shows the N11 nebula, a complex of interstellar dust and gas. The image is characterized by a network of bright green lines that trace the edges of various nebular filaments and shells. A prominent red line runs diagonally from the upper left towards the lower right, likely representing a shock front or a major filament. In the center-right area, two specific regions are highlighted: G2, a small, irregularly shaped area outlined in red, and G3, a larger, elongated region filled with a light purple color and outlined in blue. The background is a dark, grainy field of stars and diffuse nebular emission.
